Course Code	Course Name	Semester	Theory	Practice	Lab	Credit	ECTS
EM 512	Mathematical Programming	1	4	0	0	3	8

Prerequisites	
Admission Requirements	

Language of Instruction	English		
Course Type	Compulsory		
Course Level	Masters Degree		
Objective	The objective of the course is to familiarize the student with mathematical modeling and the basic tools of mathematical programming to the extent they can be applied in operational situations. The material is quite practical and will prove useful in personal decision making as well as in many types of engineering and management decisions.		
Content	 Introduction and organization Overview of modeling Introduction to linear programming Graphical solution Linear programming model Assumptions of linear programming Additional modeling examples The simplex method Standard form of linear programming Unrestricted variables Simplex method in tabular form Artificial starting solution The big M method Special cases in simplex method application Degeneracy Unbounded solutions Infeasible solution Presentation of Lineor programming Duality Definition of the dual problem Principle method Sensitivity analysis The transportation problem Introduction problem The transportation problem The transportation problem Cassing expression Cast programming Characteristics of dynamic programming Characteristics of dynamic programming problems Principle of optimality Selected dynamic programming
