G261	Operational Research	3	3	0	0	3	5

Prerequisites	
Admission Requirements	

Language of Instruction	Turkish
Course Type	Compulsory
Course Level	Bachelor Degree
Objective	Operations research aims to apply scientific approaches in order to design and manage systems with scarce resources. This course, which is compulsory in the curriculum, enables students to provide the optimal solution to the problems encountered in an organization. The material will prove useful for improving and optimizing the performance of an organization. In this context, the aims of this course are as follows: • Formulating mathematical models for real world problems. • Introducing the solution methods for mathematical programming models. • Examining the validity of the models and interpreting the obtained results.
Content	Introduction to linear programming and graphical solution method, Example problems for linear programming, Simplex method, Two-phase simplex method, Special cases for simplex method, Sensitivity analysis, Assignment problem and Hungarian algorithm, Transportation problem and transportation simplex algorithm

Theory Topics

Week	Weekly Contents
1	Introduction to linear programming and graphical solution method
2	Example problems for linear programming
3	Example problems for linear programming
4	Simplex method
5	Simplex method
6	Two-phase simplex method
7	Special cases for simplex method
8	Special cases for simplex method
9	Midterm
10	Sensitivity analysis
11	Sensitivity analysis
12	Assignment problem and Hungarian algorithm
13	Transportation problem and transportation simplex algorithm
14	Transportation problem and transportation simplex algorithm
