Content

Admission Requirements

Language of Instruction French
Course Type Compulsory
Course Level Bachelor Degree

The course is an introduction to the theoretical foundations of modeling and estimation methods used in many

statistical applications. It provides essential mathematical perspective and tools and underlines the role of

mathematics in applied statistics.

Introduction: Modelisation of random events Part I: Special probability distributions

Discrete distributions (uniform, bernoulli, binomial, geometric, hypergoemetric,

negative binomial, poisson)

Continuous distributions (uniform, exponential, gamma, chi-square, beta, normal)

Part II: Moments

Central and non-central moments Moment generating functions Part III: Estimation and inference

Part III: Estimation and interence

Sampling, Law of Large Numbers and Central Limit Theorem

Point estimation (method of moments and maximum likelihood estimation)

Sampling distribution of estimators

Confidence intervals Hypothesis testing

Part IV:Simple linear regression

Ordinary least square estimation of parameters
