Course Code	Course Name	Semester	Theory	Practice	Lab	Credit	ECTS
MAT301	Metric Topology	5	3	2	0	5	8

Prerequisites	MAT101, MAT102
Admission Requirements	MAT101, MAT102

Language of Instruction	French
Course Type	Compulsory
Course Level	Bachelor Degree
Objective	The aim of this course is to introduce the theory of metric spaces and teach the fundamental properties and applications of these structures. By learning the concept of metric spaces, students will gain a deep understanding of important results in analysis and topology. Additionally, the course aims to develop students' skills in abstract mathematical thinking.
Content	This course aims to teach the fundamental concepts of the theory of metric spaces. Initially, the basic properties on $\mathbb{R}$ and sequences in $\mathbb{R}$ will be covered, followed by an introduction to the concept of metric spaces, supported by various examples. The open and closed sets in metric spaces will be discussed, and the fundamental properties of these structures will be examined. The convergence of sequences in metric spaces and the concept of complete metric spaces will be studied in detail. The concept of continuous functions and continuity in metric spaces will also be included in the course content. Furthermore, the notion of compactness in metric spaces will be emphasized and studied in detail over three weeks. In the final part of the course, the Banach fixed-point theorem and its various applications will be discussed.

## Theory Topics

Week	Weekly Contents
1	Properties of the set of real numbers
2	Sequences in the set of real numbers, accumulation points of sets, limit values of sequences
3	Open and closed subsets of the set of real numbers
4	Metric spaces: definition and examples
5	Open and closed sets in metric spaces
6	Sequences and convergence in metric spaces, accumulation points of sets, limit values of sequences
7	Topological properties of metric spaces: completeness
8	Topological properties of metric spaces: compactness
9	Topological properties of metric spaces: connectedness
10	Sequences and limits in function spaces
11	Open and closed sets in function spaces
12	Topological properties of function spaces
13	Banach fixed-point theorem
14	Applications of the Banach fixed-point theorem
